

Evaluation of conservation policies needs attention to implementation

Eeva Primmer
Finnish Environment Institute

3rd European Environmental Evaluators Network (EEEN) Forum “Linking evaluation findings to enhancing sustainability”, theme Exploring the Influence of Evaluation Knowledge 28-29 May, Helsinki, Finland

Conservation policy evaluations

- Biodiversity
 - Complex
 - Degrading
- Conservation evaluations rely on science
 - Elaborate ways of measuring
 - Increasing evidence on degradation
 - But the alarming findings do not change practice
- **Why does biodiversity policy fail?**

Conserving biodiversity = preserving habitats and species

- EU 2020 biodiversity strategy targets:
 - Halt the loss of biodiversity and the degradation of ecosystem services
- Biodiversity convention 2020 targets:
 - Prevent extinction of known threatened species
 - Protect at least 17 per cent of terrestrial and inland water areas

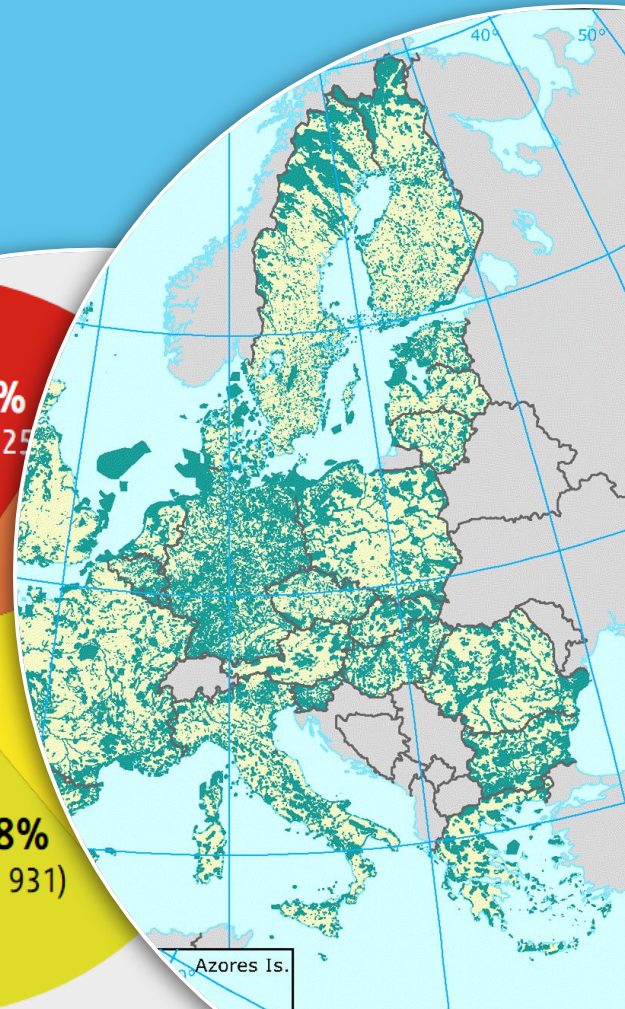

→ **What to evaluate?**

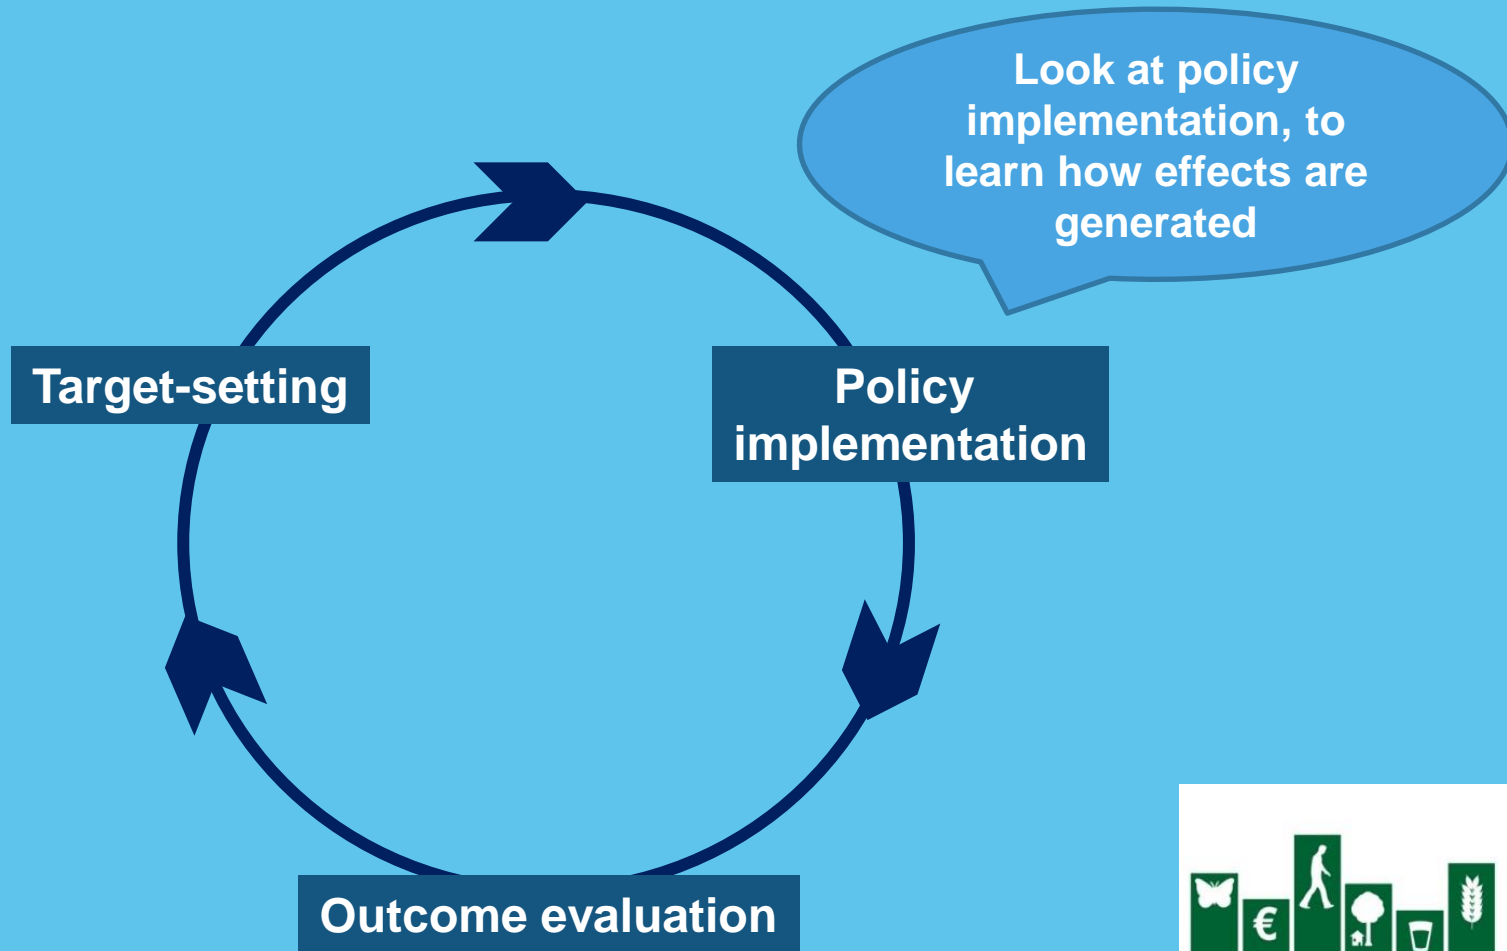

What to evaluate

- Numbers of endangered species
- Percentages
- Hectares

→ What lies between targets and outcomes?

What lies between targets and outcomes?

Implementation rests on people, groups, and organizations

Policy implementation and governance

- Top-down implementation
- Scientific-technical implementation
- Adaptive governance & collaboration
- Managing strategic behavior

→ How do these produce effects?

Top-down implementation

Rules and policies are enforced at lower levels

- Policies express values based on generalizations, negotiations and compromises
 - Assumes bureaucratic responsibility & matching institutions
- **Mismatches might undermine policy**

Analyze lower level and sector policies

Primmer, E. 2011. Analysis of institutional adaptation: integration of biodiversity conservation into forestry, Journal of Cleaner Production, 19:16, 1822-1832.

Scientific-technical implementation

Feeding scientific knowledge to implementation

- To support conservation
 - Assumes that too little knowledge is used
- **In addition to knowledge, practice is conditioned by competencies and professional norms**

Analyze resources and integration into existing practices

- Primmer, E., Wolf, S. A. 2009. Empirical accounting of adaptation to environmental change: organizational competencies and biodiversity conservation in Finnish forest management. *Ecology and Society* 14(2): 27.
- Primmer, E., Karppinen, H. 2010. Professional judgment in non-industrial private forestry: Forester attitudes and social norms influencing biodiversity conservation, *Forest Policy and Economics*, 12:2, 136-146.

Adaptive governance & collaboration

Integrating knowledge and interests into practice

- Allows negotiating & iterating
 - Assume that networks at policy, project and operational levels learn and commit
- **But knowledge is transferred also through closed contract-like ties**

Analyze information and trust in open and contractual relations

Primmer, E. 2011. Policy, project and operational networks: channels and conduits for learning in forest biodiversity conservation. *Forest Policy and Economics*, 13:2, 132–142.

Managing strategic behavior

Negotiating with competing interests

- Goals are constantly redefined and iterated
- Assumes narrow interests

→ **Proactive early implementation can frame practice more broadly**

Analyze private and public sector actor's interests and behavior

- Saarikoski, H., Åkerman, M., Primmer, E. 2012. The Challenge of Governance in Regional Forest Planning: An Analysis of Participatory Forest Program Processes in Finland. Society & Natural Resources, 25:7, 667-682.

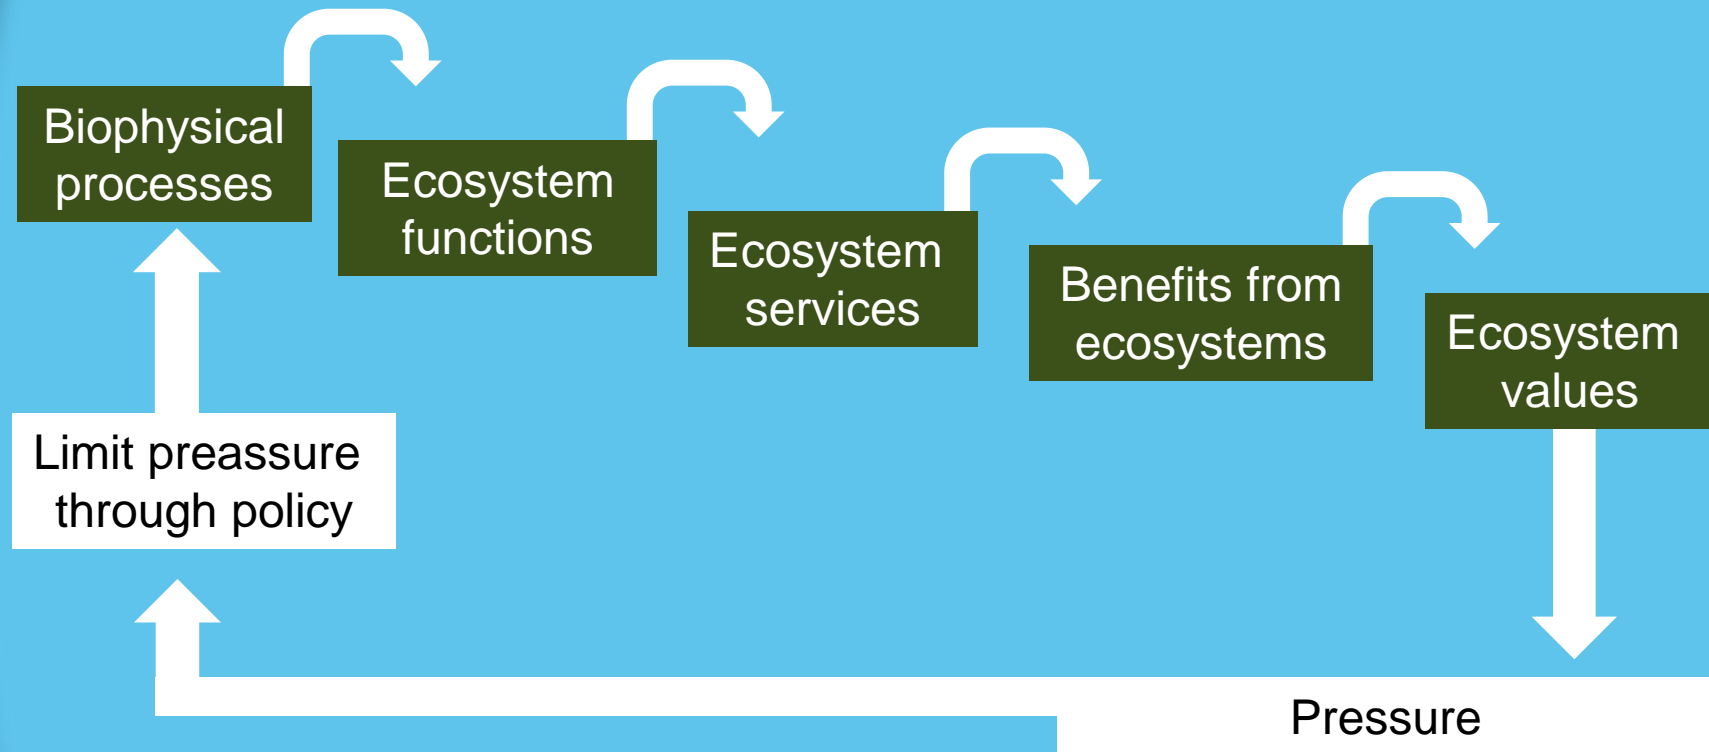

New holistic approaches: ecosystems and ecosystem services

- Complexity & systemic interactions
- Humans
- Benefits
- "Decision-making"

→ Target something like "Harnessing complex ecosystems because they provide benefits"

A conceptualisation of ecosystem services pays attention to interactions

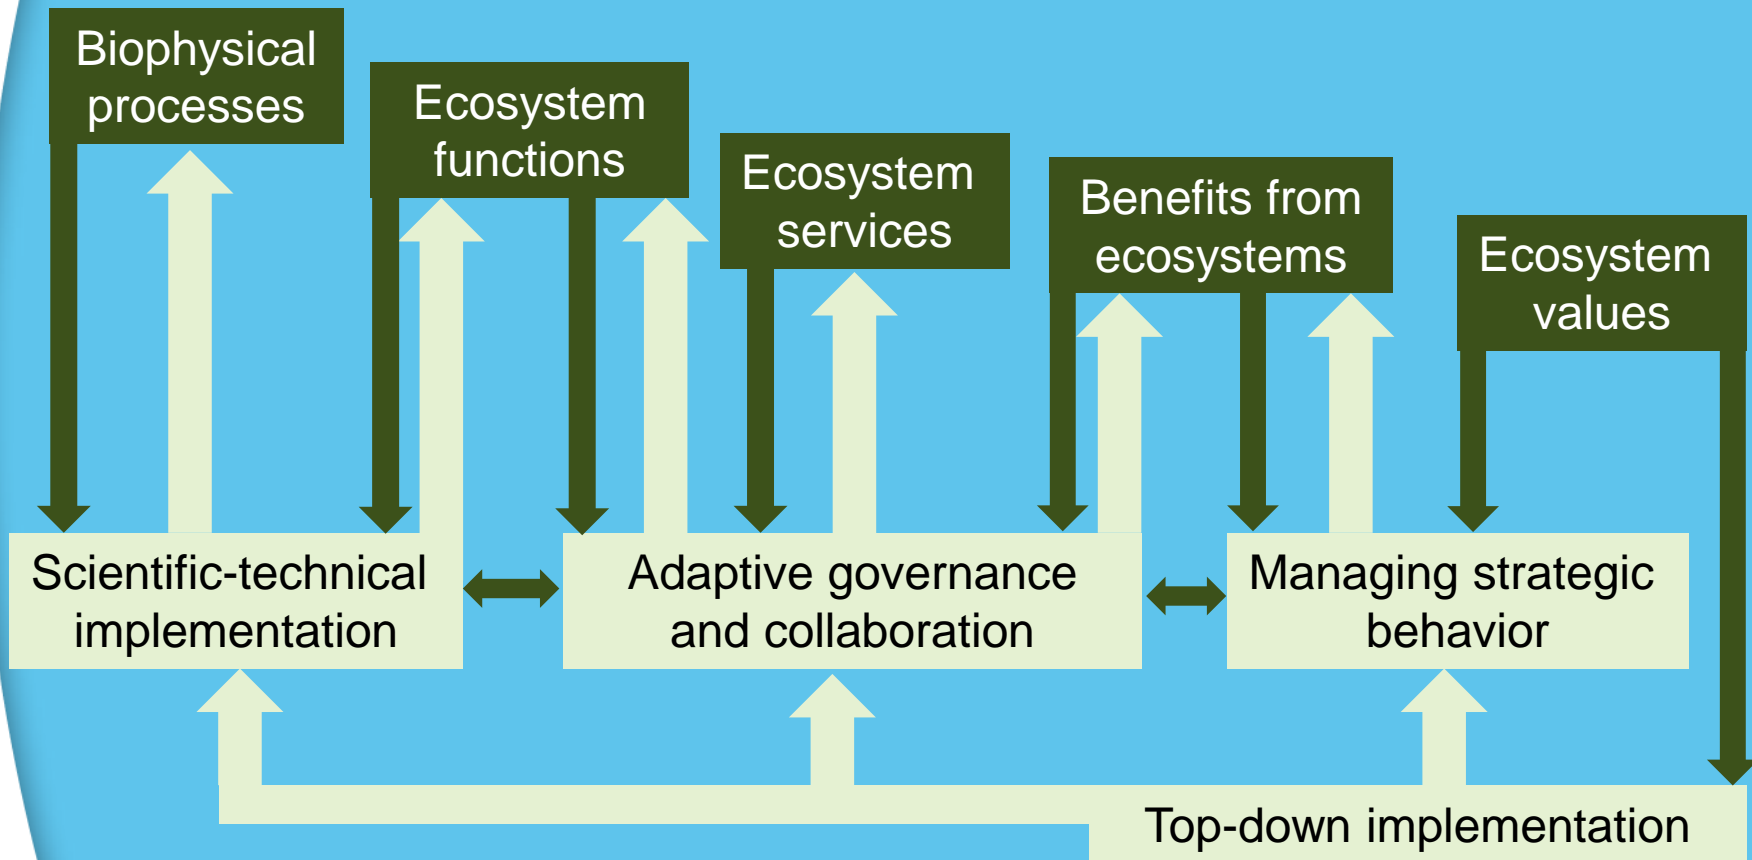

Evaluations turn complex...

	Mountains, Moorlands & Heaths	Semi-natural Grasslands	Enclosed Farmland	Woodlands	Freshwater Openwaters, Wetlands & Floodplains	Urban
Stock/Aquaculture	↘	↔	↗	↔	↘	↔
Trees, standing vegetation, peat	↘	↔	↗	↗	↘	↔
Water supply	↔	↘	↘	↔	↘	↔
Wild species diversity	↔	↘	↘	↗	↘	↔
Environmental settings: Local places	↔	↔	~	↗	↗	↔
Environmental settings: Landscapes/seascapes	↔	↔	↔	↗	↔	↔
Climate	↔	↔	↗	↗	↔	↘
Hazard	↘	↔	↘	↗	↘	↘
Disease and pests	↔	↔	±	↘	↘	~
Wine	↘	↘	↘	↔		↔
Water quality	↔	↗	±	↔	±	±
Soil quality	↔	↘	↘	↔	↘	↘
	↔	↔	↗	↗	↔	

... but where is implementation?

Conceptual model for governance of ecosystem services

Implementation analysis is not new

- Public administration
- Planning practice
- Biodiversity conservation & natural resource management practice
- Adaptive governance

→ **We need to make use of the findings and methods out there!**

Primmer, E., Furman, E. 2012. Operationalising ecosystem service approaches for governance: Do measuring, mapping and valuing integrate sector-specific knowledge systems? *Ecosystem Services* 1, 85–92.

Take home

- If we plan to change practice,

→ **We must analyse implementation empirically and make use of already existing research!**

Thank you!
